Science Moment: Find Your Blind Spot

Print the kid slips at 100% on A4 · Phomemo / Itari M08F · Do not fit to page

1. Hook · about 15 seconds

"Is there a hole in what you can see right now?"

Let the children guess. Then say: “Yes — and your brain hides it.”

2. Try it · about 1 minute

Give each child a slip (or use the test at the bottom of this card).

1. Close your left eye.
2. Look at the cross with your right eye. Do not look at the dot.
3. Move the paper slowly closer or farther until the black dot vanishes.

Tip: keep staring at the cross. If the dot does not vanish, start at arm’s length and move closer slowly.

3. Why? · about 30–40 seconds

At the back of each eye, a ‘cable’ called the optic nerve carries signals to the brain. It leaves the eye through one spot.

That spot has no light-sensing cells, so it cannot see any light that lands there. That is your blind spot. You have one in each eye.

You do not see a hole. Your brain fills the gap with the colours and patterns around it.

4. Say this · easy English for the children

Close your left eye.	**Look at the cross.**	**Move it slowly.**	**The dot is gone!**

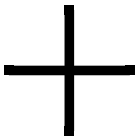

5. Wrap-up question

“Why don’t we notice our blind spot every day?”

Because we usually have both eyes open, and each eye can see the bit the other eye misses. The brain also fills the gap, so there is no hole to notice.

Teacher demo · marks are 7 cm apart · print at 100%, Do not fit to page

Close your LEFT eye. Look at the + with your RIGHT eye. Move the paper slowly closer or farther.
